Tools we used

Each tool has a real job in the swarm, from deciding to alerting to measuring

CrewAI

Flow with a hot/calm router, five agents, parallel tasks and structured outputs

Parasail

Three models split by job, embeddings for triage, schema-locked JSON backup

You.com

Live web search grounds the Lore Researcher, with cited source URLs

Discord webhook

Posts each incident alert to the venue channel, on hot ticks only

Scenario MCP feed

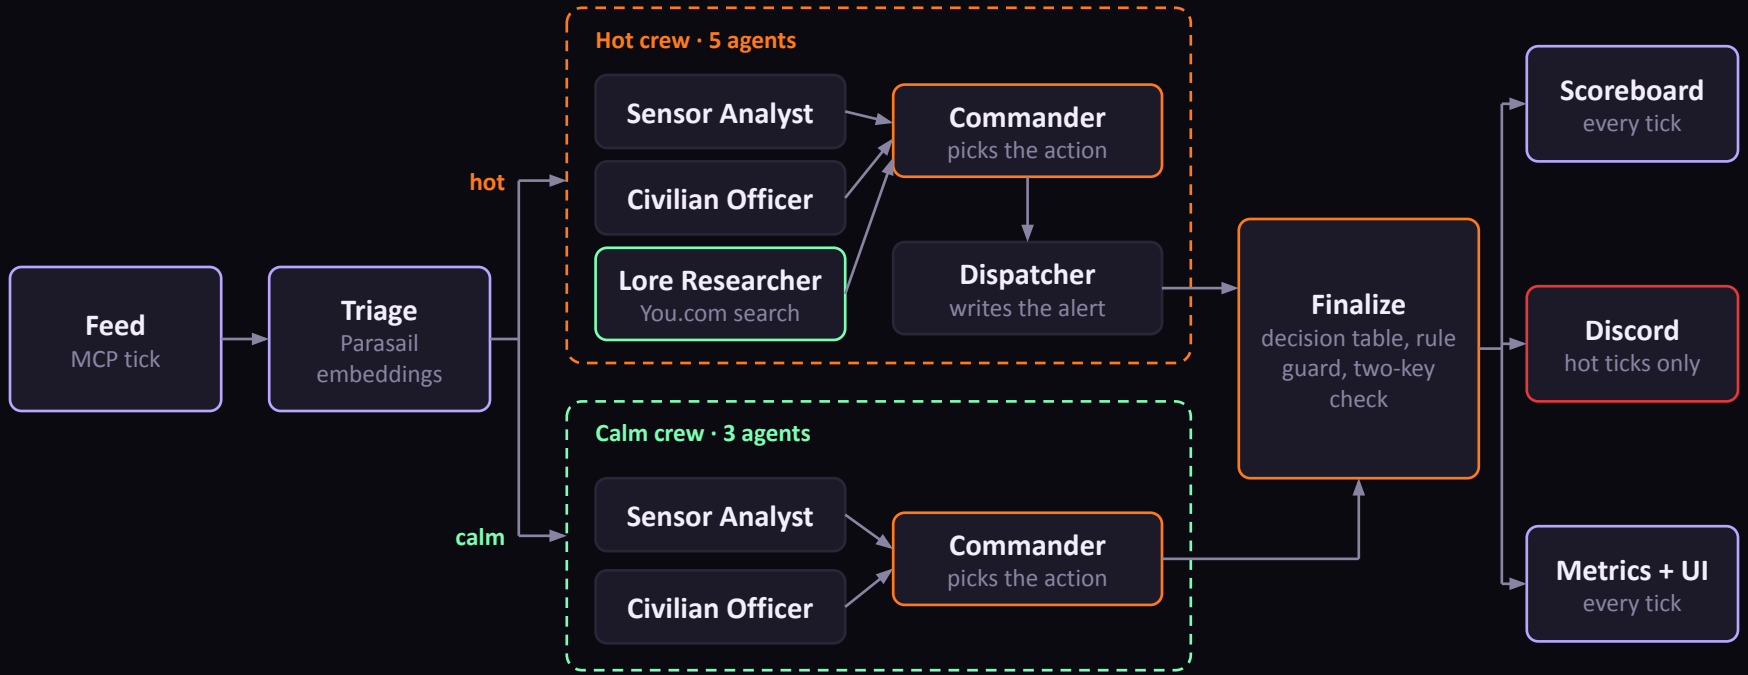

Pulls ticks and submits decisions to the live scoreboard

Metrics + UI events

Per-model tokens, cost, latency, streamed to the live command center

The pipeline, tick by tick

Triage routes each tick to the full or the light crew; every path ends in one guarded decision

Future uses

Swap the ghost feed for a real one; keep the swarm, the guard and the two-key alert

Security operations

Triage SOC alerts: one agent per signal, web threat intel as lore, page on-call only when two agents agree

Smart buildings

Fire, gas and occupancy sensors per floor: evacuate where people are, contain empty zones

Industrial monitoring

Equipment telemetry by plant zone: separate real faults from sensor noise before stopping a line

Emergency dispatch

Incoming incident reports: weigh hazards and people at risk, alert the right channel fast
